Audible Geographies in Latin America examines the audibility of place as a racialized phenomenon. It argues that place is not just a geographical or political notion, but also a sensorial one, shaped by the specific profile of the senses engaged through different media. Through a series of cases, the book examines racialized listening criteria and practices in the formation of ideas about place at exemplary moments between the 1890s and the 1960s. Through a discussion of Louis Moreau Gottschalk's last concerts in Rio de Janeiro, and a contemporary sound installation involving telegraphs by Otávio Schipper and Sérgio Krakowski, Chapter 1 proposes a link between a sensorial economy and a political economy for which the racialized and commodified body serves as an essential feature of its operation. Chapter 2 analyzes resonance as a racialized concept through an examination of phonograph demonstrations in Rio de Janeiro and research on dancing manias and hypnosis in Salvador da Bahia in the 1890s. Chapter 3 studies voice and speech as racialized movements, informed by criminology and the proscriptive norms defining "white" Spanish in Cuba. Chapter 4 unpacks conflicting listening criteria for an optics of blackness in "national" sounds, developed according to a gendered set of premises that moved freely between diaspora and empire, national territory and the fraught politics of recorded versus performed music in the early 1930s. Chapter 5, in the context of Cuban Revolutionary cinema of the 1960s, explores the different facets of noise—both as a racialized and socially relevant sense of sound and as a feature and consequence of different reproduction and transmission technologies. Overall, the book argues that these and related instances reveal how sound and listening have played more prominent roles than previously acknowledged in place-making in the specific multi-ethnic, colonial contexts characterized by diasporic populations in Latin America and the Caribbean.

The origin of life is one of the biggest unsolved scientific questions. This book deals with the formation and first steps of the chemical evolution of nucleic acids, including the chemical roots behind the origin of their components from the simplest sources in a geochemical context. Chemical evolution encompasses the chemical processes and interactions conducive to self-assembly and supramolecular organization, leading to an increase of complexity and the emergence of life. The book starts with a personal account of the pioneering work of Stanley Miller and Jeffrey Bada on the Chemistry of Origins of Life and how the development of

organic chemistry beginning in the 19th century led to the emergence of the field of prebiotic chemistry, situated at the frontier between organic, geo- and biochemistry. It then continues reviewing in tutorial manner current central topics regarding the organization of nucleic acids: the origin of nucleobases and nucleosides, their phosphorylation and polymerization and ultimately, their self-assembly and supramolecular organization at the inception of life.

He introduces a series of constructs to support this argument, but the more interesting and novel theses are to be found in his vivid description of the social forces that resist the predatory state and how they have carved out a modicum of autonomy based on what he describes as an elaborate value system of badness/honour.
