Submitted Assignment from the year 2019 in the subject Business economics - Supply, Production, Logistics, , language: English, abstract: This paper is about logistics and wants to distinguish between domestic and global logistics. Additionally, it discusses the driving forces for the internationalization of logistics and the related challenges. Today, logistics has acquired a wider meaning and is used in business for the movement of raw materials from suppliers to the manufacturer and finally the finished goods to the consumers. Logistics is also referred to as physical distribution. No other area of business operations involves the complexity or spans the geography of logistics. All around the world, 24 hours of every day, seven days a week, during 52 weeks a year, logistics is concerned with getting products and services where they are needed at the precise time desired. It is difficult to visualize any marketing, manufacturing or international commerce without logistics. Domestic logistics involves tracking and coordinating the flow of goods and services from their sources until the customer receives a final product within the same country. So "international logistics" refers to the flow of goods, services, or people between different countries

International Logistics 1 Introduction This book is about international logistics and the international logistics system.

International means that it will deal with transactions involving individuals or firms in more than one nation. Logistics means the organized movement of goods, services, and, sometimes, people. Logistics was originally a military term. For example, in author Tom Clancy's novel, *Red Storm Rising*, Russian General Alekseyev thought to himself about a battlefield situation: "The tactics ... no, amateurs discuss tactics. Professional soldiers study logistics. ,,1 When one speaks of the international logistics system, he means that huge array of carriers, forwarders, bankers, traders, and so on that facilitate international transactions, trades, and movements of goods and services. Communications are important, and a logistics system includes whatever communication capability it needs.

Global Logistics Management focuses on the evolution of logistics in the last two decades, and highlights recent developments from a worldwide perspective. The book details a wide range of application-oriented studies, from metropolitan bus routing problems to relief logistics, and introduces the state of the art on some classical applications. The book addresses typical logistic problems, most specifically the vehicle routing problem (VRP), followed by a series of analyses and discussions on various logistics problems plaguing airline and marine systems. The text addresses problems encountered in continuous space, and discusses the issue of consolidation, scheduling, and replenishment decisions together with routing. It proposes a methodology that supports decision making at a tactical and operational level associated with daily inventory management, and also examines the three-echelon logistic network. This material provides numerous examples and additional topics that include: An analysis for the airline industry and a novel approach for airline logistics including fare pricing and seat inventory control The berth-crane allocation problem in container terminals A marine system logistics application Ice navigation problems and factors that affect ice navigation Pharmaceutical warehouse route design problems An application in healthcare logistics in which medical suppliers are evaluated through a fuzzy linguistic representation model A real data-driven simulation model that outputs a new shuttle system A model that integrates routing and batching problems Joint replenishment and transportation problems Global Logistics Management clearly illustrates logistic problems encountered in many different application areas, and provides you with the latest advances in classical applications.

This book is organized as follows: Chapter 1 introduces logistics and supply chain management and contains some primal definitions about these two concepts; some obstacles, prerequisites and infrastructures of modernized logistics and supply chain management and global supply chain management are illustrated.
