This book is an ideal reference guide for clinicians seeking to improve their decision making and treatment outcomes when placing dental implants in medically compromised patients, in whom conditions for osseointegration and soft tissue healing may be unfavorable. Up-to-date information is provided on the potential impacts of a wide variety of diseases and disorders on dental implant treatment and the factors that need to be considered when deciding on the feasibility of such treatment. More specifically, for each condition possible disease-related changes in the oral environment are explained and key treatment issues are identified, including surgical and prosthodontic aspects and pharmacological considerations. The book will help general dentists, periodontists, and oral surgeons to reduce the risk of treatment failure and complications and to ensure that the implant therapy is successful in achieving

excellent quality of life and functional benefits, thereby improving patient satisfaction. Advanced Practice in Critical Care provides experienced critical care nurses with a clear and distinct evidence base for contemporary critical care practice. Central to the book is the application of research and evidence to practice and therefore, case studies and key critical care clinical situations are used throughout to guide the reader through the patient care trajectory. Each chapter introduces an initial patient scenario and as the chapter progresses, the patient scenario develops with the theoretical perspectives and application. In this way, it is evident how multi-organ dysfunction develops, impacting upon and influencing other body systems, demonstrating the multi-organ impact that is often experienced by the critically ill patient. In this way, consequences of critical illness such as acute renal failure, haemostatic failure and liver dysfunction are explored. Throughout the text, key research findings and critical care treatment strategies are referred to, applied and evaluated in the context of the given patient case study. Advanced assessment techniques are explained and the underlying pathophysiology is discussed in depth. Advanced Practice in Critical Care is an essential resource for experienced practitioners within critical care whom primarily care for patients requiring high dependency or intensive care.

This book is open access under a CC BY 4.0 license. It constitutes a unique source of knowledge and guidance for all healthcare workers who care for patients with sepsis and septic shock in resource-limited settings. More than eighty percent of the worldwide deaths related to sepsis occur in resource-limited settings in low and middle-income countries. Current international sepsis guidelines cannot be implemented without adaptations towards these settings, mainly because of the difference in local resources and a different spectrum of infectious diseases causing sepsis. This prompted members of the Global Intensive Care working group of the European Society of Intensive Care Medicine (ESICM) and the Mahidol-Oxford Tropical Medicine Research Unit (MORU, Bangkok, Thailand) - among which the Editors – to develop with an international group of experts a comprehensive set of recommendations for the management of sepsis in resource-limited settings. Recommendations are based on both current scientific evidence and clinical experience of clinicians working in resource-

limited settings. The book includes an overview chapter outlining the current challenges and future directions of sepsis management as well as general recommendations on the structure and organization of intensive care services in resource-limited settings. Notes On Clinical Biochemistry shows how the details of molecular architecture and metabolic pathways which every biochemistry student has to learn can be summarised and made applicable to a wide range of clinical problems. This is done partly by a theoretical discussion of the links between the basic biochemistry and corresponding medical scenarios, and partly by the discussion of case histories. In this way, a very wide range of medical problems is discussed economically. This book is aimed at all those studying clinical chemistry, and medical students in the middle period of their course, that is the 2nd ? 4th years. This is when the knowledge of basic sciences gained in the earlier period comes to be applied to clinical situations, and the book attempts to show, with respect to biochemistry, how this continuum is achieved.
