This report welcomes the overall direction of the Government's proposed legislation to reform provision for children with special educational needs (SEN), but warns that the NHS Constitution cannot be allowed to prevent the imposition of much stronger duties on commissioning boards to ensure that adequate, joined-up services are put in place. Draft legislation relies too heavily in its current form on the duty of joint commissioning between Health and local authorities to ensure co-operation throughout the system. It will be essential that the forthcoming regulations commit Health providers to specific timetables when conducting SEN assessments and that responsibilities for Health and local authorities in providing certain therapy services are substantially clarified. The Committee also calls for all current protections afforded by a Statement of SEN to be maintained and recommends that the Code of Practice should also remain a statutory document. The Committee notes how the 'pathfinder projects' set up to test the approaches described in the 2011 Green Paper on SEN have not had time to report back in order to advise on the development of the legislation. MPs welcome the Minister's decision to extend the Pathfinders for a further 18 months, but point to several aspects of the new legislation where learning from the Pathfinders will be particularly important, not least how to ensure the 'Local Offer' put in place is sufficient to ensure the

This book provides a comprehensive overview of modern computer-based techniques for analyzing the structure, properties and dynamics of biomolecules and biomolecular processes. It is organized in four main parts; the first one deals with methodology of molecular simulations; the second one with applications of molecular simulations; the third one introduces bioinformatics methods and the use of experimental information in molecular simulations; the last part reports on selected applications of molecular quantum mechanics. This second edition has been thoroughly revised and updated to include the latest progresses made in the respective field of research.

Complexes of physically interacting proteins constitute fundamental functional units that drive almost all biological processes within cells. A faithful

reconstruction of the entire set of protein complexes (the "complexosome") is therefore important not only to understand the composition of complexes but also the higher level functional organization within cells. Advances over the last several years, particularly through the use of high-throughput proteomics techniques, have made it possible to map substantial fractions of protein interactions (the "interactomes") from model organisms including *Arabidopsis thaliana* (a flowering plant), *Caenorhabditis elegans* (a nematode), *Drosophila melanogaster* (fruit fly), and *Saccharomyces cerevisiae* (budding yeast). These interaction datasets have enabled systematic inquiry into the identification and study of protein complexes from organisms. Computational methods have played a significant role in this context, by contributing accurate, efficient, and exhaustive ways to analyze the enormous amounts of data. These methods have helped to compensate for some of the limitations in experimental datasets including the presence of biological and technical noise and the relative paucity of credible interactions. In this book, we systematically walk through computational methods devised to date (approximately between 2000 and 2016) for identifying protein complexes from the network of protein interactions (the protein-protein interaction (PPI) network). We present a detailed taxonomy of these methods, and comprehensively evaluate them for protein complex

identification across a variety of scenarios including the absence of many true interactions and the presence of false-positive interactions (noise) in PPI networks. Based on this evaluation, we highlight challenges faced by the methods, for instance in identifying sparse, sub-, or small complexes and in discerning overlapping complexes, and reveal how a combination of strategies is necessary to accurately reconstruct the entire complexosome.
